Understanding the Overall Poll Bias Score – A perfect bias score as compared to the 2020 exit polls equals a 0 value. A positive score equals a Democratic bias. A negative score equals a Republican bias. The higher the value of the number, the worse the bias. I will adjust polls with this score in mind. Usually the adjustment is straightforward in that I can apply the proper party ID, gender ID, education ID to the party votes provided in the cross tabs. Sometimes pollsters hide the party ID, gender ID or education ID, but I have methods of inferring those. The calculators for inferring these party ID values can be found below. Regional bias usually can't be inferred, although if they provide how each region votes they can.

Ipsos is not releasing their cross tabs, except very selectively, like almost nothing. Their non-college white vote matched the NYT Sienna number somewhat closely. I applied NYT/Sienna's numbers for the other three education categories and extrapolated what the Education ID must be to get the result ABC arrived at. This is inferred in that it is an educated guess. I also show another scenario just below where the splits are more favorable to Harris than NYT shows, which should help ABC here. It still shows they used at best a 45/55 B.A.+ / non-B.A. Split, an impossible scenario in the real world vote. They mostly likely used something like a 47/53 or 48/52 split, but this is just an educated guess.

Points earned	0.64	0.35	0.42	0.55
	28.8	15.75	23.1	30.25

In this scenario I am giving the maximum benefit of the doubt to ABC. It still shows a BA+ / non-BA split that is always going to bias the poll towards Harris far too much.
